Timasi Werema

Software Engineer

Dallas, TX | timasiwerema@gmail.com | linkedin.com/in/timasi-werema | github.com/timwerema

SUMMARY

Computer Science student (B.S., May 2027) with internship experience building full-stack automation at Nokia and four years supporting production payment systems at a major sports and entertainment venue. Works across Node.js, JavaScript, cloud infrastructure (AWS, Kubernetes, OpenShift), and retrieval-augmented AI.

EDUCATION

The University of Texas at Dallas · B.S. Computer Science — Expected May 2027

EXPERIENCE

Nokia · AI RAN Intern — May 2025 - Aug 2025

- Built a full-stack validation portal for virtualized 5G RAN components (vCU/vDU) across EKS-A, OpenShift, and Wind River, reducing manual validation time by 65%.
- Engineered a Node.js/Express backend that runs shell-based checks over SSH, parses infrastructure diagnostics, and returns structured JSON - reducing verification errors by 40%.
- Designed a responsive HTML/CSS/JavaScript interface with node-specific workflows, expandable diagnostics, real-time status indicators, and input validation.
- Partnered with 5G RAN engineers to validate containerized network function deployments - Kubernetes services, networking, monitoring, and storage - across 3+ infrastructure environments.

Levy at American Airlines Center · POS Technician — Nov 2022 - Present

- Install, configure, and maintain concession POS terminals and peripherals - payment readers, barcode scanners, and receipt printers - during high-volume sports and concert events.
- Diagnose hardware, software, and network incidents on site and remotely; document fixes in ticketing workflows and restore devices to service quickly to limit disruption.

PROJECTS

Good Days · AI SOP Assistant · Capstone — 2026

- Contributed to a retrieval-augmented generation (RAG) assistant that surfaces approved SOP guidance using Amazon Bedrock Knowledge Bases and S3-backed vector storage.
- Built and evaluated keyword-query tests and "insufficient evidence" responses so the assistant declines rather than guesses when sources are missing.
- Investigated PostgreSQL-backed session history and fallback-model options to keep follow-up conversations reliable.

Galacticals SC · Soccer Club Web Platform — 2026

- Built and refined a JavaScript club website for events, training sessions, and member information, with Supabase-backed authentication and data.
- Moved protected data access into Netlify Functions, separating client authentication from club data.
- Hardened event displays with safe fallback handling so pages stay usable when data is missing.

AI Code Review & Automation Toolkit · Development project

- Created AI-assisted code review and test-generation workflows that surface security, logic, and style issues.
- Documented reusable quality checks and review patterns for developers.

TECHNICAL SKILLS

Languages: Java, Python, C/C++, JavaScript, SQL (MySQL, PostgreSQL), HTML/CSS

Frameworks & Tools: Node.js, Express, React Native, REST APIs, Git, Docker, Linux, SSH, Firebase, Supabase

Cloud & AI: AWS (Bedrock, S3), Kubernetes, OpenShift, Containerized network functions, RAG, Netlify
